Abstract:

In the present work, taste masking of **Vidarabine** was carried out by using HP- β -CD inclusion complex. These taste-masked complexes were further formulated into the Oro dispersible tablet by the direct compression method using Ac-Di-Sol and Avicel as a super disintegrant. **Vidarabine** is used in treatment of AIDS. This research has described the production of a taste masked dosage form from initial determination of threshold bitterness concentration of the pure drug through to the development of a final taste masked prototype formulation. It was found that the taste masked 1:2 ratio of LMV: HP- β -CD inclusion complex increases the bulk of final ODT blend (above 1000 mg) which is not feasible for formulation of ODTs. So, in this study the ODTs of LMV: HP- β -CD inclusion complex (1:1 ratio) showing acceptable bitterness in human taste panel studies was used in formulation ofODTs. In all formulations, the dispersion produced was soft (without grittiness) with a good mouth feel, and the bitter taste was fully masked. In vitro drug release profile of all optimized ODT formulations showed around 90% of drugs release within 10 to 15 minutes in acidic buffer (pH 1.2), implying that the drug will be absorbed fast, increasing the chances ofbioavailability. A three-month stability analysis was carried out. For the optimized formulations, there was no noticeable difference in disintegration time, hardness, friability, or drug content

Keywords: Vidarabine, super disintegrant, Orodispersible

INTRODUCTION:

Oral is the most preferred route of drug administration, but is not suitable for the patients with dysphagia. To overcome this problem or dispersible tablets is one of the famous technological innovations in the contract manufacturing and pharmaceutical field.Taste masking and taste assessment are the two main factors taken into consideration while formulating ODTs as they disintegrate and/ or dissolves in oral cavity. Taste masking in addition is related to patient compliance. Patient compliance is particularly important in pediatrics, geriatric and long drug therapypatients.

An ODT is a drug dosage form available for a small variety of over-the-counter (OTC) and prescription drugs(4). ODT disintegrates and/ or dissolves rapidly in the mouth without the need for water, which makes it suitable during traveling without immediate access to water. Since swallowing the saliva containing the dissolved or dispersed medication, the drug is consumed normally. Any drugs in ODT are showing fast onset of action and improved bioavailability as

compared to same drugs in traditional tablet dosage form. This is due to ODTs pregastric absorption. ODT is also the best formulation option for drugs with a first-passeffect.

METHODS

Formulation of ODTs of Vidarabine-HP-β-CDComplex.

After adding superdisintegrants such as croscarmellose sodium (Ac-DI-Sol), sodium starch glycolate (SSG), and a mixture of both in different concentrations, orodispersible tablets of drug: polymer complex were prepared using the direct compression process. As the optimized ratio 1:2 of LMV: HP β -CD complex in the optimization increased the total bulk of ODT, was not selected for further formulation of ODTs of LMV-HP β-CD Complexes. So the three formulations of LMV: HP β -CD (1:1) complex (which is batch F1 in Table 4-10) were prepared. Mannitol (Perteck M) and microcrystalline cellulose (Avicel PH 102) were mixed thoroughly in a glass mortar using a pestle.

RESULTS AND DISCUSSION:

Vidarabine (Azidothymidine)- HP-β-CD Inclusion Complex Formation by Kneading Method Experimental Design:

The effect of factors X1 and X2 is found to be statistically significant in nature. Response variables i.e. entrapment efficiency and drug content are simultaneously optimized using desirability function using Design Expert software. This process allows the selection of most suitable level of factors to achieve desired level of drug content and entrapment efficiency. The results of multiple linear regression analysis revealed that for obtaining desirable drug content (91.76%) and entrapment efficiency (more than 67.07%), the formulation should be prepared using 1:2 drug polymer ratio with kneading time of 40 minutes.

| 120 | 22.94 | 22.80 | 22.99 | 22.91 | | | |

Threshold Bitterness Concentration for Vidarabine was found to be 40 g/ml. *In vitro* release of Vidarabine from LMV: indion 234 (1:1.5) complex was 22.91 g/ml below threshold bitterness concentration i.e., 40 g/ml upto time period of 120 seconds.

In-vivo Taste Evaluation of LMV-HP-β-CDcomplexes.

Taste of drug and complex was checked by time intensity method. The six healthy human volunteers were used for taste masking and informed consent was obtained from all of them. Bitterness was measured by consensus of a trained taste panel, with 20mg of sample held in the mouth for 5 to 10 sec., then spat out: the bitterness level was then recorded.

These volunteers were instructed not to swallow the granules, which were placed on the tongue. They were instructed to thoroughly gargle their mouth with distilled water after the completion of test.

Determination of Drug Content in the Drug-PolymerComplex

Drug content of LMV: indion 234 (1:1.5) complex.

The resinate prepared (containing 10 mg of LMV) was subjected for evaluation of drug content and the data obtained is shown in Table 7. It was observed that the practical concentration obtained was 9.91 ± 0.043 mg, which was almost 99.1 % of theoretical concentration that is 10 mg.

Table 9: Drug content of LMV: indion 234 (1:1.5) complex

| Name of Complex | | Theoretical Conc. | Practical Conc. | % Drug Content |
|-----------------|--------|-------------------|-----------------|----------------|

In vitro release profile of formulated tablets:

Dissolution test of tablets was performed using acidic buffer pH 1.2 with USP dissolution type II apparatus at 100 rpm and 37 \pm 0.5⁰C temperatures. Test sample (5 ml) was withdrawn at a particular time interval and replaced with fresh dissolution media maintained at 37 \pm 0.5⁰C. The test sample was filtered through membrane filter having size 0.45 µm and analyzed using UV spectrophotometer at λ_{max} values. This test was performed on successive three tablets and mean \pm SDcalculated.

Accelerated Stability Studies of the OptimizedODTs.

Accelerated stability studies were carried out according to an International Conference on Harmonization (ICH) guidelines. The optimized formulations were placed in aluminum capped transparent glass vials for three months under storage conditions of 45^{0} C± 2^{0} C and 75%±5%. At the end of each month, these samples were removed and analyzed for post compressiontests.

The stability analysis showed that all of the formulations were physically stable when maintained at $45^{0}C\pm 2^{0}C$ and $75\%\pm 5\%$ RH for three months, with no major differences in the findings. (88).

SUMMARY AND CONCLUSION:

Oral is the most preferred route of drug administration, but is not suitable for the patients with dysphagia. To overcome this problem orodispersible tablets is one of the famous technological innovations in the contract manufacturing and pharmaceutical field.Taste masking and taste assessment are the two main factors taken into consideration while formulating ODTs as they disintegrate and/ or dissolves in oral cavity. Taste masking in addition is related to patient compliance. Patient compliance is particularly important in pediatrics, geriatric and long drug therapy patients.

It was found that the taste masked 1:2 ratio of LMV: HP- β -CD inclusion complex increases the bulk of final ODT blend (above 1000 mg) which is not feasible for formulation of ODTs. So in this study the ODTs of LMV: HP- β -CD inclusion complex (1:1 ratio) showing acceptable bitterness in human taste panel studies was used in formulation of ODTs.

In vitro drug release profile of all optimized ODT formulations showed around 90% of drugs release within 10 to 15 minutes in acidic buffer (pH 1.2), implying that the drug will be absorbed fast, increasing the chances bioavailability's three-month stability analysis was carried out. For the optimized formulations, there was no noticeable difference in disintegration time, hardness, friability, or drug content.

Overall this study conclude that, taste-masked ODTs of the drug Vidarabine not only improve patient compliance but also overcome neglected dysphagia associated with these two drug therapies. A greater understanding of patient compliance in any of the drug treatment will allow proper formulations to be developed which in turn will improve treatment outcomes.
